Environmental Information for the Electricity Product

This is a new energy product. Allegheny Energy has made no guarentee as to the environmental characteristics of the energy to be supplied from January through December, 2000. The data shown below are default values, and do not necessarily reflect the energy that Allegheny Energy will supply.

Electricity can be generated in a number of ways with different impacts on the environment. The standardized environmental information shown below allows you to compare this electricity product with electricity products offered by other suppliers.

| Energy Source  | `  |   | Air Emmissions  |  | Energy Conservation   |
|--|--|---|---|--|---|
| Default values are<br>shown which represent<br>1996 regional values. | Coal Gas Hydroelectric (large) Nuclear Oil Renewable Energy Captured methane gas Fuel cells Geothermal | 49%<br>07%<br>02%<br>34%<br>06%<br>00%<br>00% | The emmission data given are default values and represent the average amount of polution associated with the generation of electricity in the region. This amount is compared to the New Jersey benchmark. The benchmark approximates the average emission rate for all electricity generation in New Jersey. | NJ Benchmark 100 %                                 | Allegheny Energy is not investing in energy conservation measures for this electricity product. Energy conservation measures means less electricity needs to be generated and pollution is avoided. |
| Renewable energy<br>sources subtotal 02%                             | Hydroelectric (small) Solar Solid Waste Wind Wood or other biomass TOTAL                               | 00%<br>00%<br>02%<br>00%<br>00%               | CO, is a "greenhouse gas" which may contribute to global climate changes. SO, and NO <sub>x</sub> react to form acids found in acid rain. NO <sub>x</sub> also reacts to form ground level ozone, an unhealthful component of "smog."   | 0% CO <sub>2</sub> NO <sub>X</sub> SO <sub>2</sub> |   |
